Linux Nano Text Editor

Linux 'nano' is a simple, user-friendly command-line text editor often included by default in many Linux distributions. It is used to create, edit, and manipulate plain text files directly in the terminal.

Key Features of Nano:

- Easy to use: Designed for beginners with straightforward commands displayed at the bottom of the screen.

- Simple navigation: Users can navigate using arrow keys, making it accessible for those unfamiliar with advanced text editors.

- Basic text editing: Supports common text editing tasks such as cut, copy, paste, find, and replace.

- No programming knowledge required: Unlike more advanced editors like Vim or Emacs, nano doesn't have a steep learning curve.

Example Usage:

To use nano, you can open a terminal and type:

bash

nano filename.txt
